FileBear
Documentation for Buyers

CONTENTS

Installation

When initially uploading the software to your server you'll be prompted with an installer containing the following steps_

1. Underline: General Agreement

It is important to understand that you as administrator of the system the software is running on are solely responsible for all files or action taken with our software. That's why we decided to include this agreement in our installer – just to make sure.

2. Environment Requirements

Verify that all needed PHP modules are installed correctly.

3. Verify the Database Connection

A database is needed to run this software. Please enter the database credentials into the form displayed and click "Continue". If the connection was established successfully the installer will create the database configuration file.

4. Inserting Data into the Database

After the installer has verified the connectivity of your database, it'll create all tables and default settings necessary for running our software.

5. General Settings

On this page, you'll be asked to provide a page title and a thumbnail for your new FileBear installation. A page title is necessary, the thumbnail is optional but strongly recommended.

6. Initial User

At the end of the installation you'll be asked to create a new user. This user will have full administrative permissions and your admin account!

7. Complete the Installation

After you've created the initial user, please delete the *==/installer==* directory for your own safety.

First Steps

After you've successfully completed the installer, you can now login with your user account. Immediately after you've logged in you'll be redirect to the admin dashboard. At the beginning, you'll be prompted with the following warning messages:

Upload Limits for users not defined.
User's won't be able to upload any files (unless they are premium users) until you define upload limits for them.

Email notifications not enabled. Users won't receive e.g. registration emails.
FileBear relies on its strongly developed communication module. Please configure an email account for outgoing mails. Unless you do so, users won't receive:

- Registration Emails
- Password Reset Emails
- Subscription Renewal Emails
- Sharing Notification Emails

Common Error Messages

Disable sql_mode=only_full_group_by
Run the following in your MySQL console:
SET GLOBAL sql_mode=(SELECT REPLACE(@@sql_mode,'ONLY_FULL_GROUP_BY',''));

Redirct URL wrong
If the redirect url doesn't point to the right direction, you can modify it manually in the configuration file (application/config/config.php).

Change: $config['base_url'] = '';
To e.g.: $config['base_url'] = 'http://mypage.com/filebear';
